 - ◆ I, G descriptions of initial and goal situations.

- For a given plan horizon N , the problem P is encoded as a CNF theory $T(P)$ whose size is polynomial in the size of P

- In the classical setting, there is one-one correspondence between models of $T(P)$ and plans of length N , and thus planning can be reduced to model finding.

- A NNF is **decomposable** if no variable appears in more than one conjunct for each conjunction node;
- A NNF is **deterministic** if the disjuncts of each disjunction node are pairwise logically inconsistent;
- A d-DNNF (Darwiche 2001) supports a number of operations
 - ◆ satisfiability,
 - ◆ clause entailment,
 - ◆ model counting,
 - ◆ (restricted) projection,
 - ◆ etc.in linear time in the size of the NNF.

Compiling Theories into d-DNNF

Introduction

Conformant Planning

Deterministic DNNFs

- Negation Normal Forms
- Decomposable and Deterministic NNFs
- Compiling into d-DNNF

The Conformant Planner

Experimental Results

Wrap Up

Thanks

- Compiling theories into d-DNNF is NP-hard but no harder than compiling into OBDDs
- Indeed, OBDDs can be efficiently translated into d-DNNFs; but not the other way around
- d-DNNF compilers exploit decomposition, unit resolution, dynamic variable ordering, etc.
- In proposed planner, first step is to compile CNF theory into d-DNNF
